

ABSTRACT OF THE DISCLOSURE

A domain, which is a basic constituent for processing the issuance and receipt of orders for parts, executes processing for order issuance, order receipt, machining
5 planning, constructional expansion and ordering planning, thereby decentralizing processing of information relating to parts issuance and inventory. It is possible to realize sufficiently high processing speed even with a small-sized system. In addition, the resulting system allows parts
10 management on a real-time basis. The system lends itself to enlargement and rapid changes in production scheduling that accompany an increase in number of parts, this not be readily feasible with conventional centralized information management.
